Process Chemistry of Coal Utilization - 1st Edition

The processes for production of specific chemicals from coal are typically proprietary systems using specialized process systems. In the following discussion, some of the processes for important chemicals such as formaldehyde, olefins, etc. are presented. Methanol (MeOH) is of course another important primary chemical made from coal syngas; however, it is also a liquid fuel in its own right ...

Coal - Coal - Coal types: Coals contain both organic and inorganic phases. The latter consist either of minerals such as quartz and clays that may have been brought in by flowing water (or wind activity) or of minerals such as pyrite and marcasite that formed in place (authigenic). Some formed in living plant tissues, and others formed later during peat formation or coalification.

The chemical equation for the combustion of coal is  $C + O_2 = CO_2$ . In this equation, C represents the carbon in the coal, which reacts with air, represented by  $O_2$ , to form carbon dioxide, or  $CO_2$ . Advertisement. When coal combustion occurs in an environment low on oxygen, the equation  $C + CO_2 = 2CO$  may result.
