A key component of any hydroponic system is the support structure for your plants. The most common system for DIY hydroponics is the combination of net pots and a substrate. A net pot is simply a pot with holes or slits in the sides to allow the root system to reach the nutrient solution below.

Small-scale hydroponics | DM Extension  
It is ideal for growing plant cuttings and plants with short growth cycles. Ideal temperatures are between 68 and 70 degrees Fahrenheit. High temperatures may cause plants to become stunted, and if the water temperature gets too high, it may lead to root rot. The ideal humidity for a hydroponic grow room is from 40 to 60 percent relative humidity.

In an NFT hydroponic system, the growing channels are set at a slight tilt to create a rate of flow that results in a very shallow stream of nutrient solution. As a general rule, the flow rate in your channels should be around 1 liter per minute, which is about .26 gallons per minute or just shy of 16 gallons per hour.
